Guidelines, Second Edition Elsevier Health Sciences

This brand new, revised and expanded edition is aimed at all candidates planning to sit European institution competitions and who wish to prepare as effectively as possible for the abstract reasoning test. Abstract reasoning questions are presented as series of diagrams containing geometric shapes which are repeated or modified according to a logical sequence. Candidates have to identify the underlying logic and find the diagram that completes the series. Abstract reasoning tests call for skills that candidates do not normally use in everyday life: the ability to visualise geometric transformations (rotations, symmetries, etc), an aptitude to spot similarities between complex shapes, etc. We are all capable of developing these skills. It is not a question of intelligence, but of learning. Entry competitions for European institutions are highly selective. Success in the abstract reasoning test is, above all, a matter of method and training. This book can significantly increase your chances of success. It includes: - a detailed methodology illustrated with numerous examples; - 9 tests of 20 questions each, arranged by level of difficulty; - a detailed explanation of the answer to each question. The questions in this book are similar to those set in the competitions run by EPSO since 2015. They are different from those in previous editions and from our online test questions.

Consciousness in Humanoid Robots Network4Learning, Inc.

There is an inherent stratification in the way we process data in our daily lives. Many simple data inputs, for example, in a question asking whether a person is hungry or not, the answer is binary and usually simple to process. More complex questions of a certain type would require the answering person to search for a term in the memory. These types of questions are commonplace in day to day work and in interviews or questions in examinations. Specific advantages of these questions, in a competitive setting, includes the payoff of diligent preparations when the syllabus is not too big. Some disadvantages also remain. The disadvantages include the inability to have a reasonable guess, with the help of logic or experience, for questions which has no leads in any direction. Who was the first man to climb Mount Everest? If we do not know about Norgay and Hillary, it is impossible to guess (even with that 'hill' in the name, no disrespect). These two types lead us to another strata of questions. The questions involving abstraction and big-picture thinking. The term may sound too broad or even mystical, but it is a word fit for this type of question. The process of abstraction involves taking away the inessential parts of an object so that only essential parts remain. It can be simple, as in choosing the legible part of a multi-language menu card in a restaurant. Or it can be complex, as in answering a (hard) puzzle from this book. Big-picture thinking stresses on association of different topics in our head and pondering on them so that a solution can emerge. It is common in the IQ tests which measure a specific kind of intelligence. It is common in aptitude questions in a large number of tests for job or academics. It is also common in interviews, for example in the Physics department of one of the most reputed universities of Britain, where a question was asked along the lines of- "You are in a prison cell. There is a pipe in the wall through which water is flowing. Using a light bulb, how would you determine the direction of the flow?" As we can see, this question requires us to think in a big-picture way and also use abstract thinking. It is not a case of plugging in the formulae and getting the answer. This final type of question can be easier to attempt if we have a lot of practice, and it will be even better if we can call the practice 'fun' . This book is a small step in that direction. You have to identify a single word, when being provided with a one or two sentence clue. It is simple. Yet it can also be

complex at times. Better yet, if you can pinpoint another word which makes it more apt in the question, it would be fabulous. If you practice (and play!) with a partner, it will be better yet.

Building a conscious robot is a scientific and technological challenge. Debates about the possibility of conscious robots and the related positive outcomes and hazards for human beings are today no longer confined to philosophical circles. Robot consciousness is a research field aimed at a two-part goal: on the one hand, scholars working in robot consciousness take inspiration from biological consciousness to build robots that present forms of experiential and functional consciousness. On the other hand, scholars employ robots as tools to better understand biological consciousness. Thus, part one of the goal concerns the replication of aspects of biological consciousness in robots, by unifying a variety of approaches from AI and robotics, cognitive robotics, epigenetic and affective robotics, situated and embodied robotics, developmental robotics, anticipatory systems, and biomimetic robotics. Part two of the goal is pursued by employing robots to advance and mark progress in the study of consciousness in humans and animals. Notably, neuroscientists involved in the study of consciousness do not exclude the possibility that robots may be conscious. This eBook comprises a collection of thirteen manuscripts and an Editorial published by Frontiers in Robotics and Artificial Intelligence, under the section Humanoid Robotics, and Frontiers in Neurorobotics, on the topic "Consciousness in Humanoid Robots." This compendium aims at collating the most recent theoretical studies, models, and case studies of machine consciousness that take the humanoid robot as a frame of reference. The content in the articles may be applied to many different kinds of robots, and to software agents as well.
