Probabilistic databases are databases where the value of some attributes or the presence of some records are uncertain and known only with some probability. Applications in many areas such as information extraction, RFID and scientific data management, data cleaning, data integration, and financial risk assessment produce large volumes of uncertain data, which are best modeled and processed by a probabilistic database. This book presents the state of the art in representation formalisms and query processing techniques for probabilistic data. It starts by discussing the basic principles for representing large probabilistic databases, by decomposing them into tuple-independent tables, block-independent-disjoint tables, or U-databases. Then it discusses two classes of techniques for query evaluation on probabilistic databases. In extensional query evaluation, the entire probabilistic inference can be pushed into the database engine and, therefore, processed as effectively as the evaluation of standard SQL queries. The relational queries that can be evaluated this way are called safe queries. In intensional query evaluation, the probabilistic inference is performed over a propositional formula called lineage expression: every relational query can be evaluated this way, but the data complexity dramatically depends on the query being evaluated, and can be #P-hard. The book also discusses some advanced topics in probabilistic data management such as top-k query processing, sequential probabilistic databases, indexing and materialized views, and Monte Carlo databases. A New Yorker and Fortune Best Book of the Year "A must-read for all Americans who want to remain the ones deciding what they can read, watch, and listen to." —Arianna Huffington Analyzing the strategic maneuvers of today's great information powers—Apple, Google, and an eerily resurgent AT&T—Tim Wu uncovers a time-honored pattern in which invention begets industry and industry begets empire. It is easy to forget that every development in the history of the American information industry—from the telephone to radio to film—once existed in an open and chaotic marketplace inhabited by entrepreneurs and utopians, just as the Internet does today. Each of these, however, grew to be dominated by a monopolist or cartel. In this pathbreaking book, Tim Wu asks: will the Internet follow the same fate? Could the Web—the entire flow of American information—come to be ruled by a corporate leviathan in possession of "the master switch"? Here, Tim Wu shows how a battle royale for the Internet's future is brewing, and this is one war we dare not tune out.

Endogenous glucocorticoids, such as cortisol and cortisone, are endocrine mediators of a myriad of essential physiological processes and analogs of these hormones have been employed clinically for over fifty years as potent anti-inflammatory agents. Coincident participation in other signalling pathways gives rise to many undesired side effects, leaving extended use as a last resort. Drug development efforts to dissociate desired and unwanted glucocorticoid effects have been pursued since the beginning of clinical use and while progressive deconvolution of the complexity of glucocorticoid action has offered somewhat better drugs, minimization of side effects remains limited in practice. A structure based ligand design approach was undertaken to develop dissociating non-steroidal glucocorticoid analogs. The first step was to generate a homology model of the glucocorticoid receptor ligand-binding domain, which was validated through free energy calculations. This was followed by in silico screening of a virtual compound library based on a Wieland-Miescher ketone derived scaffold. Two series of compounds were synthesized, the first incorporating the 3-carbonyl function of cortisol and in the other this moiety was replaced by a fused 4-fluorophenyl pyrazole. These compounds were characterized against canonical response elements in mammalian cell lines with reporter gene assays. The arylpyrazole compounds proved to be high affinity, selective glucocorticoid receptor ligands and a subset of these were found to dissociate transrepression from transactivation in vitro.
