We have had an operant-conditioning rat lab associated with either our Experimental or Introductory Psychology course at Western Michigan University since 1964. Many students report that the rat lab is very exciting and that they find it the best feature of our course. It has been our impression however that this lab has an even more important effect. The experience of directly modifying the behavior of another organism is a primary factor in demonstrating to students the power and validity of the basic principles of behavior.

Felipe Legarreta gives careful attention to patterns of exegesis in Second-Temple Judaism and identifies, for the first time, a number of motifs by which Jews drew ethical implications from the story of Adam and his expulsion from Eden. He then demonstrates that throughout the "Christological" passages in Romans and 1 Corinthians, Paul is taking part in a wider Jewish exegetical and ethical discussion regarding life in the new creation.

This volume examines major issues facing successful women in academic science. In doing so, Sue Rosser outlines the persisting and shifting perspectives of women who have achieved seniority and remained in academia during the last fifteen years through survey data from women who received POWRE awards from the NSF. Some evidence suggests that budget cuts and an increasing reliance on technology have impacted higher education and exacerbated gender issues, but until now, little research has focused directly on the lingering effects of these changes.

How science consultants make movie science plausible, in films ranging from 2001: A Space Odyssey to Finding Nemo. Stanley Kubrick's 2001: A Space Odyssey, released in 1968, is perhaps the most scientifically accurate film ever produced. The film presented such a plausible, realistic vision of space flight that many moon hoax proponents believe that Kubrick staged the 1969 moon landing using the same studios and techniques. Kubrick's scientific verisimilitude in 2001 came courtesy of his science consultants--including two former NASA scientists--and the more than sixty-five companies, research organizations, and government agencies that offered technical advice. Although most filmmakers don't consult experts as extensively as Kubrick did, films ranging from A Beautiful Mind and Contact to Finding Nemo and The Hulk have achieved some degree of scientific credibility because of science consultants. In Lab Coats in Hollywood, David Kirby examines the interaction of science and cinema: how science consultants make movie science plausible, how filmmakers negotiate scientific accuracy within production constraints, and how movies affect popular perceptions of science. Drawing on interviews and archival material, Kirby examines such science consulting tasks as fact checking and shaping visual iconography. Kirby finds that cinema can influence science as well: Depictions of science in popular films can promote research agendas, stimulate technological development, and even stir citizens into political action.
