Breast Cancer: Death Call or Enlightenment examines the important role fear plays in the initial decisions made when a woman is first confronted with a potential cancer diagnosis. The most intelligent and rational health care decision possible is one that is researched and

planned in advance of the cancer diagnosis. Many women are not aware that they have choices of treatments other than breast mastectomy, radiation, and chemotherapy. As the author searched for an alternative cure for cancer, she learned that finding a cure was not the answer she needed-she needed to find healing. She found that healing involved identifying and treating her spiritual imbalances. It is the author's desire that by sharing her experiences, others will gain knowledge, courage, and determination to win their battle with cancer.

"Psycho-oncology, 4th Edition is solemnly dedicated to Professor Jimmie C. Holland, M.D., internationally recognized as the

founder of the field of Psycho-oncology. Dr. Holland, who was affectionately known by her first name "Jimmie", had a profound global influence on the fields of Psycho-oncology, Oncology, Supportive Care, Psychiatry, Behavioral Medicine and Psychosomatic Medicine. At the time of her passing, Dr. Holland was the Attending Psychiatrist and Wayne E. Chapman Chair at Memorial Sloan-Kettering Cancer Center (MSK) and Professor of Psychiatry, Weill Medical College of Cornell University in New York"--

An Essential Guide to Managing Prostate Cancer for Patients and their Families Open Dissertation Press

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the

production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

Abstract: Abstract of a thesis entitled Studies of the process of breast cancer treatment decision making and its impacts on short-term adjustment to breast cancer in Chinese women submitted by Wendy Wing Tak Lam for the degree of Doctor of Philosophy at the University of Hong Kong June, 2002

Objectives: (1)

Describe the process of treatment decision making (TDM) in breast cancer (BC). (2)

Explore to what extent women wish to participate in TDM. (3) Identify factors women consider in TDM. (4) Examine how this process affects psychosocial adjustment to BC. Methods: This study had three phases. Phase I consisted of a qualitative study of 22 women with recently completed breast surgery who completed an in-depth interview designed to study Objective 1. Phase II consisted of a pilot study evaluating the reliability and validity of instruments that measured TDM, self-efficacy (GSeS), patient satisfaction with the medical consultation (MISS), and social adjustment (ChSAS). Phase III consisted of a prospective interviewed-based

study designed to study Objectives 2, 3, and 4 with assessment within 5 days, and again at one-month post-surgery. Women completed several instruments including measures of participation satisfaction, choice influence, informational support, expectancy-outcome incongruence (EOI), self-efficacy (GseS), optimism (CLOT-R), psychological morbidity (CHQ-12), social adjustment (ChSAS), and subjective health (CPH and GPH). Subjects: Phases I (N = 22) and III (N = 154): Chinese women recently diagnosed with BC who had completed breast surgery were recruited at six government-funded hospitals. Phase II (N = 226):

Chinese women who had a diagnosis of BC and had completed all the associated treatment recruited at a local BC self-help group. Analysis and Findings: Grounded theory analysis of narrative data in Phase I showed that discovery of breast abnormality and emotional responses to BC diagnosis influence the TDM process. The experience of TDM, which was likened to gambling, did not end once the decision was made, but unfolded while waiting for surgery and the post-operative report. Factor analysis was used to assess the construct validity of the instruments in Phase II. Adequate reliability statistics and reasonable construct validity were seen,

suggesting the piloted instruments were suitable to use in Phase III. Fifty-nine percent of women in Phase III preferred shared decision-making. Most women had participated as much as they desired, while participation incongruence was associated with having an opportunity to make treatment choices, perceived difficulties and perceived lack of confidence in TDM. Survival was rated as the most important factor women considered in deciding breast surgery. Women having breast conserving surgery rated surgeon's recommendation, sexuality issues, and avoidance of radiation therapy as more important factors in TDM than did women

having mastectomy. Results of path analyses indicated that (1) optimism directly effected CHQ-12 and ChSAS, (2) self-efficacy directly effected ChSAS, (3) optimism and self-efficacy indirectly effected CHQ-12 and ChSAS via its effect on EOI, and (4) EOI directly effected CHQ-12 and ChSAS. Optimism had the greatest causal effect on psychosocial adjustment. Post hoc analyses led to the extension of the path model to include severity of physical sympt

Springer Nature
Dr. Kopans' best-selling text and reference on breast imaging is now in its thoroughly revised, updated Third Edition. The author

combines a complete, superbly illustrated atlas of imaging findings with a comprehensive text that covers all imaging modalities and addresses all aspects of breast imaging-- including breast anatomy, histology, physiology, pathology, breast cancer staging, and preoperative localization of occult lesions. This edition includes state-of-the-art information on a new modality, breast tomosynthesis, as well as on digital mammography, MRI, ultrasound, and percutaneous breast biopsy. The book contains more than 1,500 images obtained with the latest technology, including many new mammograms and scans using other

imaging modalities.

FEATURES: -

Information on anatomy, histology, physiology, pathology, breast cancer staging, and preoperative localization of occult lesions - Discusses breast disease from a wider viewpoint than just how to perform and interpret mammography

NEW TO THIS EDITION: -

Digital mammography
- Major revisions in the MRI, ultrasound, and interventional sections
- Updated figures included in this edition
- Updated information on MR, US, and percutaneous breast biopsy

Gene Expression

Profiling in Non-Small Cell Lung Cancer Open Dissertation Press
Breast cancer is the most common malignant tumor

among women, accounting for an estimated 24% of all cancer cases. Current therapies are clinically efficacious, but side effects linked with these therapies are serious and can cause further harm not associated with the tumor itself. It has been hypothesized that cancer stem cells allow for resistance to chemo- and radiation therapy, and contribute to tumor spread (metastasis) and disease relapse. Therefore, the development of a novel treatment method including the targeted delivery of cytotoxic agents to the tumor mass for the treatment of advanced breast cancer is vital to improving the therapeutic index and efficacy/toxicity

balance. Taking all of this into consideration, the goals of this project were to develop novel strategies for discovering and using treatments against breast cancer. The use of a combination therapy system for drug delivery should increase the therapeutic index, and help prevent the relapse and metastasis of resistant/stem-like cancer cells. To accomplish these goals we used several unique methodologies to discover and test new therapeutics. These methodologies include: the One Bead One Compound (OBOC) screen for drug discovery, 3D culture tumor modeling for drug screening, and nanoparticle systems for optimal drug-delivery. The use of the

One Bead One Compound (OBOC) combinatorial chemistry founded by Dr. Lam and colleagues has allowed for the discovery of LMS peptides that bind specifically to breast cancer cells. These peptide ligands bind to high-mannose glycans specifically found on breast adenocarcinomas. Screening these peptides using a 3D cell culture system has been shown as an effective way to model the in vivo tumor response. The 3D culture system we use is an efficient way to screen potential therapeutics, and has provided us data that suggests growth inhibitory effects of the LMS peptides. This data suggests that the LMS peptides can be

used as both a targeting agent and therapeutic agent in our nanoparticle drug-delivery system. Our studies show that functionalized super paramagnetic iron-oxide (SPIO) nanoparticles are a highly efficient vehicle to use for this nanocarrier drug-delivery system. The LMS peptides, nanoparticles, and chemotherapeutic drug, can all be used alone as therapeutic agents, but the combined use of each of these agents will provide a treatment system that is much safer and efficacious than conventional therapies. Assessing the combined use of the LMS peptides and the nanocarrier system is the next step in evaluating the ability

of our combination therapeutic approach to increase therapeutic efficacy. The results attained from this project have provided useful data that can contribute to future discoveries in breast cancer treatment.

30 Experts Explain 15 Stages of Prostate Cancer

Lulu Press, Inc
Claire Guest was walking her dogs when Daisy, a fox red Labrador, nudged her breast insistently and stared up into her face with her big brown eyes. Sensing something was wrong, Claire visited her GP and soon found out she had a very deep - and difficult to diagnose - form of breast cancer. Daisy had saved her life, simply by smelling her cancer. With her scientific background

and deep love of dogs, Claire intuited that Daisy and her canine pals could save many more lives, and set up the charity Medical Detection Dogs. Though faced with many challenges, Claire and her dogs have proven to be a remarkable asset to cancer detection, and have changed the lives of many seriously ill people and their families. This is the story of how our relationship with dogs can unleash life-saving talents, changing not only the medical world, but our own lives too. The "People Power" Health Superbook: Book 12. Cancer Guide (Conventional and Holistic Cancer Treatments) Elsevier Health Sciences Winner of the 2006 Scotiabank Giller Prize

An astonishing literary debut centred around four students as they apply to medical school, qualify as doctors and face the realities of working in medicine, from a powerful voice in fiction. Following the interlinked stories of a group of medical students and the unique challenges they face, from the med school to the intense world of emergency rooms, evac missions, and terrifying new viruses. Riveting, convincing and precise, *Bloodletting & Miraculous Cures* looks with rigorous honesty at the lives of doctors and their patients, bringing us to a deeper understanding of the challenges and temptations that surge around us all. In this masterful collection,

Vincent Lam weaves together black humour, investigations of both common and extraordinary moral dilemmas, and a sometimes shockingly realistic portrait of today's medical profession.

Design and Characterization of Peptide Decorated Nanocarriers as Chemotherapeutic Agents in Breast Cancer Oxford

University Press, USA

This dissertation, "Gene Expression Profiling in Non-small Cell Lung Cancer" by Chi-leung, David, Lam, □□□, was obtained from The University of Hong Kong (Pokfulam, Hong Kong) and is being sold pursuant to Creative Commons: Attribution 3.0 Hong Kong License. The content of this dissertation has not

been altered in any way. We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation. All rights not granted by the above license are retained by the author. Abstract: Abstract of thesis entitled Gene Expression Profiling in Non-Small Cell Lung Cancer Submitted by LAM Chi Leung, David for the degree of Doctor of Philosophy at the University of Hong Kong in July 2007 Lung cancer is the worldwide leading cause of cancer morbidity and mortality and Hong Kong is no exception. In some Asian countries/regions including Hong Kong, there is an increasing trend of female, non-smokers and adenocarcinomas among patients with

non-small cell lung cancer (NSCLC). Surgical resection for early stage NSCLC remains as the only curative treatment while modern chemoradiation improves the survival of advanced stage NSCLC patients only marginally. In recent years, molecular targeted therapy has become the focus of clinical trials for advanced stage NSCLC, with epidermal growth factor receptor-tyrosine kinase inhibitor (EGFR-TKI) being one promising therapeutic agent. Clinical characteristics such as female, non-smoker, tumor with activating EGFR gene mutations, adenocarcinoma histology and Asian origin are independent predictors of clinical

response to EGFR-TKI. Hong Kong provides an appropriate context for studying the pathogenesis and chemotherapeutics in Chinese female non-smokers with lung cancer. The hypotheses being tested were that there is differential gene expression associated with different clinical phenotypes i.e. gender, smoking habits, and EGFR gene mutation status in NSCLC from local Chinese patients. To test these, the gene expression profiles of resected primary lung tumors, normal lung tissues, lung cancer cell lines and normal human bronchial epithelial cells (NHBEs), were analyzed. First, four new lung adenocarcinomas cell

lines (HKULC 1 - 4), two from female non-smokers and two from male smokers, were established from local Chinese. They were characterized with morphological and immunohistochemical studies, growth kinetics, and gene expression profiling with microarrays. Differentially expressed genes related to the regulation of cellular proliferation and to EGFR gene exon 18 - 21 mutations were identified. These new cell lines provide tools for future research in lung cancer and for comparisons with research findings from other ethnic groups. Second, gene expression profiling with microarrays was performed for 49 lung adenocarcinomas and

9 normal lung tissues collected from local Chinese. Unsupervised hierarchical clustering revealed stable clusters of lung adenocarcinomas versus normal lung tissues, female non-smokers and tumors bearing EGFR gene mutation at exons 18 - 21. Differential gene expression and molecular classifiers were identified and correlated clinical characteristics. The results were validated with independent test data sets from published microarray data on NSCLC. These gene expression profiling data on lung adenocarcinomas, female non-smokers and EGFR gene mutation status provide information for candidate gene selection for further

research on lung cancer in Chinese female non-smokers. Third, significant differences were found in the expression levels of nicotinic acetylcholine receptor (nAChR) subunit genes, $\alpha 6$ and $\beta 3$, between tumors arising from smokers and non-smokers, adjusted for the effects of gender. Gene expression signatures were found associated with high nAChR $\alpha 6\beta 3$ gene expression. Reversible elevations of the expression levels of nAChR $\alpha 1$, $\alpha 5$ and $\alpha 7$ subunit genes were found in Breast Cancer iUniverse. A must-read book for anyone who is going through cancer treatment, survivors, the people who care about them, and those

who are interested in living a long life without cancer. Aging is a major carcinogen! But why is aging such a threat to you getting cancer? It's simple - the longer you live, the more errors you genes accumulate. So how can you prevent cancer, while getting older? In *Live Long, Live Stronger: An Integrative Approach to Cancer Care and Prevention*, Dr. Mao, along with Frances Lam, L.Ac., shares his 30-plus years of experience in integrative oncology. They present evidence-based treatment modalities, including acupuncture and Chinese herbal medicine, diet and nutrition, mind-body practice of qi gong and meditation. All these treatments have been

used effectively to reduce side effects of chemotherapy and radiation, boost energy and vitality, and restore healthy functions in patients' immune system.

Equally important, the book reveals preventative steps everyone can take to lower his or her lifetime cancer risks, as well as decrease the reoccurrence rates of cancer survivors. They show you that while getting older is inevitable, aging is not! This book also includes personal stories of patients' cancer journey to inspire the most important healing power within - the human spirit!

[A Lighter Side to Cancer](#) Oxford Medical Publications
Cancer is a group of more than 200

diseases each of which, though different, attack some of the body's cells. Healthy cells that make up the body's tissues grow, divide and replace themselves in an orderly way to keep the body in good repair but toxic cancerous cells destroy the body. Cancer refers to all malignant tumours caused by the abnormal growth of a body cell or a group of cells. In men, cancer is usually found in the intestines, the prostate and the lungs. In women, it occurs mostly in the breast tissues, uterus, gallbladder and thyroid. The American Cancer Society has prescribed seven signs or danger signals in general which may indicate the presence of cancer. These are: a

sore that does not heal; change in bowel or bladder habits; unusual bleeding or discharge; thickening or lump in breast or elsewhere; indigestion or difficulty in swallowing; obvious change in a wart or a mole a persistent and nagging cough or hoarseness. Other symptoms may include:

Evidence-Based Treatment Springer Science & Business Media

This atlas illustrates the latest available data on the cancer epidemic, showing causes, stages of development, and prevalence rates of different types of cancers by gender, income group, and region. It also examines the cost of the disease, both in

terms of health care and commercial interests, and the steps being taken to curb the epidemic, from research and screening to cancer management programs and health education.

For complete, authoritative coverage of every aspect of thoracic and cardiac surgery, turn to the unparalleled guidance found in Sabiston and Spencer Surgery of the Chest, 9th Edition. Now in full-color for the first time, Drs. Frank W.

Sellke, Pedro J. del Nido, and Scott J. Swanson's standard-setting set is meticulously organized so that you can quickly find expert information on open and endoscopic surgical techniques performed in the operating room. With its comprehensive coverage of thoracic as well as adult and pediatric cardiac surgery, this 9th Edition is an essential resource not only for all thoracic surgeons, but also for physicians, residents, and students concerned with diseases of the chest. Find what you need quickly with short, focused chapters divided into three major sections: Adult Cardiac Surgery, Pediatric Cardiac Surgery, and Thoracic Surgery. Benefit from

the knowledge and expertise of global experts who provide a comprehensive view of the entire specialty. Master all of the most important current knowledge and techniques in cardiac and thoracic surgery—whether for specialty board review or day-to-day surgical practice. Visualize challenging surgical techniques and procedures and navigate the text more efficiently thanks to an all-new, full-color design. Stay up to date with revised or all-new chapters including Critical Care for War-related Thoracic Surgery; Neuromonitoring and Neurodevelopment Outcomes in Congenital Heart Surgery; and Quality Improvement: Surgical

Performance. Keep abreast of cutting-edge topics such as endovascular stenting and cell-based therapies, as well as the latest innovations in imaging and diagnosis, minimally invasive cardiothoracic surgery, and percutaneous devices. Sharpen your surgical skills with access to 21 procedural videos online, including 3 new videos covering Surgical Technique-VATS Sympathetic Block; Open pneumothorax; and Extent II repair of thoracoabdominal aortic aneurysm.

The Ins and Outs of Gay Sex Academic Press

Recent advances in precision medicine and immuno-oncology have led to highly specific and efficacious cancer

therapies such as monoclonal antibodies and immune checkpoint inhibitors (ICIs). This book provides an up-to-date overview of advances in the field of immuno-oncology. Chapters cover such topics as ICIs and how they mount a robust immune response against cancer cells as well as the response of ICIs to treatment predictive biomarkers and their potential immune-related adverse events (irAEs). Additionally, the book includes a comprehensive review of the powerful FDA-approved therapeutic agent doxorubicin, highlighting the molecular mechanisms behind doxorubicin's drug resistance and critical side effects.
