✓ THIS BOOK INCLUDES: "Hydroponics" and "Diy Hydroponic Gardens" Do you want to learn how to setting up a hydroponics garden in your backyard and growing plants all year round.? If yes, then keep reading... Hydroponics is the study of soilless plants. You might have heard of soil-less society, which is another term often used to explain the same thing when you haven't heard about the hydroponics. The same natural elements are used to grow plants in soils, so that weeds, soil-borne pests, and diseases do not harm the plants. Hydroponics allows us to grow plants with excellent results indoors. Most plants grow well with water indoors, as the feed does not produce large flowers or thickened foil, just adding a quality feeding schedule does not spurn the plant at all with only daylight as a light signal from outside. Nevertheless, because you cannot change our weather or lighting time, you cannot control the cycles of these plants in the first place through artificial light, which provides a constant lighting signal on a timely basis, regardless of the time of year. It was quickly noticed that the lights were on for 16 to 18 hours a day, and if changed to 10-12 hours a day, a blooming period was shifted to that of these plants under' hydroponic lighting.' When it was discovered by pure accident with cold elements outside, the stronger the light source, the greater the growth rate of these plants when the flowering occurred, of course, light alone is not likely to produce high growth or flora unless the air is full of CO2 and the nutrients and minerals are of quality. Hydroponics is now starting to play a more significant role in agricultural production around the world. Hydroponic gardening has been widely used since the 1970s, but it has become more accessible for the household grower only recently. Demand for environmentally friendly and safer goods in society has been an essential factor in this development. This book covers the following topics: What is Hydroponics? Hydroponic and the Science How Hydroponic Gardening Works Why is Hydroponics Preferred for Indoor Gardening? Advantages and Disadvantages of a Hydroponics System Types of Hydroponics Growing Systems Necessary Equipment to Build Your Own Hydroponic System Choosing the Best Lighting Medium for Your Hydroponic Plants Room Conditions and Water Quality Starting Your Seeds The Best Plants to Grow Using Hydroponics How to Maintain Your Hydroponic System Tips and Tricks to Growing Healthy Herbs, Vegetables and Fruits Nutrition for Hydroponics Mistakes to Avoid How to Build Your Own System Pests Control Common Problems and How to Avoid Them Business Tips And Information About Hydroponics Top Ten Reasons to Grow a Hydroponic Garden Enjoying the Yields Other Important Aspects of a Hydroponics System ...And so much more! Since the Hydroponic industry, to be very truthful, is still small and there are few local stores to buy supplies, the alternative is on-line garden stores that concentrate on providing hydroponic garden supplies and even ready to use, prefabricated hydroponic gardens for people who cannot wait to get started. And in cooperation with some of the best companies in the industry, however, we are endeavoring to select components, nutrients, and accessories you may need to build, sustain, and maintain the gardens featured in this publication. Ultimately, reading through this book is going to guide you through everything you will need to know. Do you want to rapidly start cultivating vegetables, fruits and herbs at your home without using land? Do you want to learn how to cultivate green plants and vegetables high in nutrients? If yes, then keep reading... First book - Hydroponics, or more correctly and in a general sense, soilless cultivation is a technology aimed at growing plants in a nutrient solution (water that contains nutrients) with or without the use of an artificial medium (sand, gravel, vermiculite, perlite, rock wool, etc.). Liquid hydroponic systems have no other means of supporting the roots of plants; systems in a solid medium, instead, use a substrate as support. Soil-free cultivation systems are also classified as open (when the nutrient solution draining from the roots is not reused) or closed (when the surplus solution is collected, corrected, and returned to the system). Soil-free crops are mostly grown in the greenhouse, often requiring high technology and substantial capital. However, they are very productive, ergonomic, efficiently use space water, and (potentially) protect the environment. Since in such agricultural systems the regulation of the air and radical environment is one of the main aspects, the production takes place through the parallel control of the temperatures of the air and of the roots, of the light, of the relative humidity of the air, of the water, plant nutrition and climatic adversities. This book covers a plenty idea that surely you'll be needed: What is hydroponic gardening? The benefits and disadvantages of hydroponics Different kinds of hydroponic gardening How to make your own system Setup and run a hydroponic system How to establish the budget and which type of plants, vegetables and herbs are best suited for each method of gardening ...And much more Second book - If you have ever brushed off the growing popularity of microgreens as simply some form of modern meal craze which will fade after a while, then you should have changed your mind by now. Microgreens are no longer reserved for fancy restaurants and high-end groceries that sell them at high prices. They have now available to be had by everybody that wants to eat healthily and maintain a healthy diet. You don't even have to buy them in the supermarkets. You can grow them on your very own, in your back yard or even inside. Introducing microgreens into your weight loss program might be easy considering these micro-sized vegetables are versatile and can be incorporated into diets in a lot of unique ways. Now that you know the different kinds of microgreens and how to grow them, you could get started on your healthy food regimen as soon as you like. Look for fresh, crisp microgreens with the correct color. Avoid any that seem limp, brown, bruised, soft or wilted. The greatest guarantee of freshness is to grow your microgreens and harvest with sharp scissors. Store cut microgreens unwashed and gently wrapped in a plastic bag or a plastic clamshell box in the refrigerator's cold drawer. They'll stay sparkling for 5 to 7 days; some varieties will keep for up to 2 weeks. Microgreens are most often used clean and uncooked. They can also be used as elements in an extensive range of meals from appetizers and soups to mixed drinks and smoothies. Wash just before using them. Microgreens are also great to grow because they are healthy superfoods. If you grow them in your home, you will always have them to throw on top of a salad or blend into a smoothie. It adds a convenient way to get extra vitamins, antioxidants, and nutrients into your daily diet. **Hydroponics and Greenhouse Gardening** Independently Published

Do you want to grow your own vegetables, fruits, and herbs, but don't have so much space outside? Are you tired of having to spend money on fruit and vegetables, with the risk that they are genetically modified and treated with pesticides and toxic chemicals? Do you want to know how to start growing plants through an environmentally friendly method? Among modern methods of growing crops, Hydroponics occupies a special place because of the many benefits it offers. It is nothing more than means the cultivation of plants without soil but in water. And the water is enriched with nutrients. The history of the emergence of hydroponics is associated with centuries of research by scientists, as a result of which a huge number of experiments were carried out that made it possible to determine the optimal balanced nutritional composition to ensure the vital activity of plants. As it turned out, the soil environment for crops is not necessary plants successfully grow and develop if their root system is in contact with an aqueous medium containing all the necessary substances. This fact became fundamental for the development of hydroponics as a new method of crop production. Through hydroponics, you no longer have to worry about removing weeds, and fighting pests in the soil. Plants that grow in a hydroponic system are healthier and grow faster. Another advantage is that through specific extensions, a hydroponic system can also be supplied semi-automatically or fully automatically. Therefore, it is particularly suitable for those who do not have a large garden, guaranteeing perfect results. Hydroponics is important as its further development and improvement of which will help solve the global problems of humankind, including the most significant among them - providing food to an ever-growing number of people on our planet. All these factors confirm the need to search for new, more effective methods of growing crops, one of which is hydroponics. In this book we will discuss the following topics: How hydroponic gardening works - Growing plants without soil How to build your own hydroponic system Clarification of understandings of different types of hydroponic gardens The different types of hydroponic systems and their pros and cons Choosing the right hydroponic system Tips and tricks to growing healthy herbs, vegetables and fruits Maintenance of your hydroponic garden - myths and mistakes to avoid Starting a hydroponics business With respect to planting without soil, whether for business, for personal consumption, for leisure, or aesthetic purpose, this book holds in it all the details you need. Even if you have an idea of hydroponic systems, the totalistic nature of the content in this book will provide you with more than several good ideas that you can, and should be using. Soil-free crops are mostly grown in the greenhouse, often requiring high technology and substantial capital. However, they are very productive, ergonomic, efficiently use space water, and (potentially) protect the environment. Since in such agricultural systems the regulation of the air and radical environment is one of the main aspects, the production takes place through the parallel control of the temperatures of the air and of the roots, of the light, of the relative humidity of the air, of the water, plant nutrition and climatic adversities. This book covers a plenty idea that surely you'll be needed: What is hydroponic gardening? The benefits and disadvantages of hydroponics Different kinds of hydroponic gardening How to make your own system Setup and run a hydroponic system How to establish the budget and which type of plants, vegetables and herbs are best suited for each method of gardening ...And much more ② Second part: In this book you will learn about all the things related to greenhouse farming. From the basics of traditional greenhouse till different greenhouse elements that are required for optimal growth of your crop. You will also learn about different heating and cooling units, pests and pest control strategies that may be useful during pest invasion. In this book you will learn about: The basis of greenhouse gardening How to plan and design a greenhouse Greenhouse essential equipment and accessories Plant production in a greenhouse Classic Greenhouse designs Pests Plant diseases Pest Control Beneficial Insects Useful Tips for better plant production This guide is beneficial for beginners to improve their crop and improve their greenhouse quality to produce larger and healthier fruits and vegetables. ★ 55% OFF for Bookstores! LAST DAYS! ★ Did you know growing your own food is both environmentally friendly and healthier than most other forms of food? Hydroponic gardening uses water and nutrients to grow crops instead of soil, so it's far more efficient than traditional gardening. Because they're mass produced in a controlled environment, each crop requires fewer resources for growing. As a result, hydroponic farming is less damaging to the environment overall. Most hydroponic crops are grown in soil-free trays called "compots", which are replenished by watering the roots of the plants. This means no soil needs to be removed from the ground for growing plants. It also reduces the amount of waste created during the process. Hydroponic gardens can even be used for many microgreens. This means you can grow greens in your home, organically, without ever having to dig up the ground! All you have to do is water and care for your crop as you would any other salad greens.
