The old masters of dealt only with the static features of the positional rules of chess. But these are insufficient to explain the basics of chess. The problem is that chess, like in other sciences, has undergone a dynamic revolution, but chess literature doesn't yet reflect it. In this major work Aagaard accessibly explains the rules of attack (the exploitation of a dynamic advantage), balanced between understandable examples, and deep analysis. Five years in the making, this book deals with weak kings, sacrifices, various minor attacking themes, intuitive sacrifices, opposite castling, modern king hunts, and enduring initiative.

Mighty oaks stood guard at my country school, deeply rooted from the time before people began landing at Plymouth Rock. Their pungent perfume invited me to come and play. Their presence did not vary except in fall when their leaves turned brown and fell to the ground. They stood as strong as a bull and as independent as a Scotsman unaffected by the winds of circumstance. Such were our ancestors: the Olsons, Krugers, Matthews, Hamlins, and Mortons. Each family came from similar backgrounds, but experienced life in different ways. These stories form a symbolic tapestry and create a record of our existence. Everyone may have similar experiences but none the same because we are unique individuals. These stories are important for future generations to ponder a time past and reflect on why we are who we are. Vladimir Nabokov wrote, "Important if for no other reason, than these tales will be lost if not recorded."

Numerical procedures based on the 2-D and 3-D full potential equations and the 2-D Navier-Stokes equations were developed to study the effects of leading and trailing edge flap motions on the aerodynamics of parallel airfoil-vortex interactions and on the aerodynamics and acoustics of the more general self-generated rotor blade vortex interactions (BVI). For subcritical interactions, the 2-D results indicate that the trailing edge flap can be used to alleviate the impulsive loads experienced by the airfoil. For supercritical interactions, the results show the necessity of using a leading edge flap, rather than a trailing edge flap, to alleviate the interaction. Results for various time dependent flap motions and their effect on the predicted temporal sectional loads, differential pressures, and the free vortex trajectories are presented. For the OLS model rotor, contours of a BVI noise metric were used to quantify the effects of the trailing edge flap on the size and directivity of the high/low intensity noise region(s). Average reductions in the BVI noise levels on the order of 5 dB with moderate power penalties on the order of 18 pct. for a four bladed rotor and 58 pct. for a two bladed rotor were obtained.
