What are the processes, from conception to adulthood, that enable a single cell to grow into a sentient adult? The processes that occur along the way are so complex that any attempt to understand development necessitates a multi-disciplinary approach, integrating data from cognitive studies, computational work, and neuroimaging - an approach till now seldom taken in the study of child development. Neuroconstructivism is a major new 2 volume publication that seeks to redress this balance, presenting an integrative new framework for considering development. Computer and robotic models provide concrete tools for investigating the processes and mechanisms involved in learning and development. Volume 2 illustrates the principles of 'Neuroconstructivist' development, with contributions from 9 different labs across the world. Each of the contributions illustrates how models play a central role in understanding development. The models presented include standard connectionist neural network models as well as multi-agent models. Also included are robotic models emphasizing the need to take embodiment and brain-system interactions seriously. A model of Autism and one of Specific Language Impairment also illustrate how atypical development can be understood in terms of the typical processes of development but operating under restricted conditions. This volume complements Volume 1 by providing concrete examples of how the 'Neuroconstructivist' principles can be grounded within a diverse range of domains, thereby shaping the research agenda in those domains.

Thinking About Children collects thirty-one papers, of which twenty-eight have never previously been published. As might be expected, they range widely in tone and content from concise clinical observations to more general meditations including the landmark paper "Towards an objective study of human nature". Of particular interest are sections on autism and psychosomatics, where the author's thinking can be seen to foreshadow more recent developments, such as Frances Tustin's work on autism. Together with a substantial introduction by the editors, this book is indispensable for those acquainted with the author's work, and an ideal introduction for those who have not yet encountered the extraordinary clarity and depth of his thought.

This reference provides concise information on the treatment and management of inherited metabolic diseases for the clinician. World experts cover all commonalities of therapy giving practical advice and guidance for daily practice. All established treatment protocols in this quickly developing area of medicine are clearly described, including follow-up protocols and monitoring. Alternative and experimental therapies are also described and evaluated. Numerous tables, figures, and several indices (symptom, disease name, tests, etc.) allow rapid access to specific details. This book is invaluable to anyone dealing with patients with inherited metabolic diseases, pediatricians, internists, neurologists, and clinical geneticists.

This book provides a comprehensive and up-to-date review of all aspects of childhood Acute Lymphoblastic Leukemia, from basic biology to supportive care. It offers new insights into the genetic pre-disposition to the condition and discusses how response to early therapy and its basic biology are utilized to develop new prognostic stratification systems and target therapy. Readers will learn about current treatment and outcomes, such as immunotherapy and targeted therapy approaches. Supportive care and management of the condition in resource poor countries are also discussed in detail. This is an indispensable guide for research and laboratory scientists, pediatric hematologists as well as specialist nurses involved in the care of childhood leukemia.

Respected economist and journalist Loretta Napoleoni shows how the world is being reshaped by dark economic forces creating victims out of millions of ordinary people whose lives have become trapped inside a fantasy world of consumerism. A world built by organisations both private and public which have accumulated vast fortunes and enormous political influence by regulating, containing and manipulating the market to their own advantage.

Second in a series of publications from the Institute of Medicine's Quality of Health Care in America project Today's health care providers have more research findings and more technology available to them than ever before. Yet recent reports have raised serious doubts about the quality of health care in America. Crossing the Quality Chasm makes an urgent call for fundamental change to close the quality gap. This book recommends a sweeping redesign of the American health care system and provides overarching principles for specific direction for policymakers, health care leaders, clinicians, regulators, purchasers, and others. In this comprehensive volume the committee offers: A set of performance expectations for the 21st century health care system. A set of 10 new rules to guide patient-clinician relationships. A suggested organizing framework to better align the incentives inherent in payment and accountability with improvements in quality. Key steps to promote evidence-based practice and strengthen clinical information systems. Analyzing health care organizations as complex systems, Crossing the Quality Chasm also documents the causes of the quality gap, identifies current practices that impede quality care, and explores how systems approaches can be used to implement change.

An updated, essential guide for the laboratory diagnosis of haemoglobin disorders This revised and updated third edition of Haemoglobinopathy Diagnosis offers a comprehensive review of the practical information needed for an understanding of the laboratory diagnosis of haemoglobin disorders. Written in a concise and approachable format, the book includes an overview of clinical and laboratory features of these disorders. The author focuses on the selection, performance, and interpretation of the tests that are offered by the majority of diagnostic laboratories. The book also explains when more specialist tests are required and explores what specialist referral centres will accomplish. The information on diagnosis is set in a clinical context. The third edition is written by a leading haematologist with a reputation for educational excellence. Designed as a practical resource, the book is filled with illustrative examples and helpful questions that can aide in the retention of the material presented. Additionally, the author includes information on the most recent advances in the field. This important text: • Contains a practical, highly illustrated, approach to the laboratory diagnosis of haemoglobin disorders • Includes "test-yourself" questions and provides an indispensable tool for learning and teaching • Presents new material on antenatal screening/prenatal diagnostic services • Offers myriad self-assessment case studies that are ideal for the trainee Written for trainees and residents in haematology, practicing haematologists, and laboratory scientists, Haemoglobinopathy Diagnosis is an essential reference and learning tool that provides a clear basis for understanding the diagnosis of haemoglobin disorders.

The first sections of the book present basic concepts, development and diffusion of health care technology assessment. Separate chapters present case studies of prevention medical imaging, surgical practice, drugs, and picture archiving and communications systems (PACS). The final section has chapters on Sweden, the UK, the Netherlands, the USA, Mexico, and China to exemplify how different countries deal with health care technology. This section also has an overview of national and international efforts in health care technology assessment and a conclusion section describing the role health care technology assessment could play in different countries, depending particularly on their wealth and level of development.

European law is an increasingly important factor in the development and implementation of national and local health policy. Yet for many it remains shrouded in mystery. The situation with regard to laws impacting on health care is especially problematic as, typically, consequences arise from policies designed primarily to address problems in other sectors, which then establish general principles whose applicability to health care only becomes apparent once interpreted by rulings of the European Court of Justice. This book, written with the health and social policy community in mind, provides a comprehensive assessment of the main implications of EU law in certain key areas of health care.

Major accidents are rare events due to the many barriers, safeguards and defences developed by modern technologies. But they continue to happen with saddening regularity and their human and financial consequences are all too often unacceptably catastrophic. One of the greatest challenges we face is to develop more effective ways of both understanding and limiting their occurrence. This lucid book presents a set of common principles to further our knowledge of the causes of major accidents in a wide variety of high-technology systems. It also describes tools and techniques for managing the risks of such organizational accidents that go beyond those currently available to system managers and safety professionals. James Reason deals comprehensively with the prevention of major accidents arising from human and organizational causes. He argues that the same general principles and management techniques are appropriate for many different domains. These include banks and insurance companies just as much as nuclear power plants, oil exploration and production companies, chemical process installations and air, sea and rail transport. Its unique combination of principles and practicalities make this seminal book essential reading for all whose daily business is to manage, audit and regulate hazardous technologies of all kinds. It is relevant to those concerned with understanding and controlling human and organizational factors and will also interest academic readers and those working in industrial and government agencies.

A quick, non-invasive, non-intrusive and cost-effective method with high reliability and high validity is much in demand for the early detection of neurological anomalies which point to cerebral palsy and developmental deficits later on in life. Over his years as a distinguished developmental neurologist, Heinz Prechtel has devised such a method; a qualitative assessment of general movements (GMs) as a specific predictor for neurological impairments. His method is described in this book. GMs form part of a distinct pattern of movements in preterm babies, term newborns and

young infants. They are complex, frequent, and usually of sufficient length. Changes in the normal quality of GMs are a reliable indicator of brain dysfunction. Includes a CD-ROM giving 15 cases selected from the book. Each is of about one minute in duration and demonstrates the different age-specific movement patterns.

An International Perspective CRC Press

This book gives an overview of the most salient themes in present-day bioethics. The book focuses on perspectives typical for the European context. This highlights not only particular bioethical themes such as social justice, choices in health care, and health policy (e.g., in post-communist countries), it also emphasizes specific approaches in ethical theory, in relation to Continental philosophies such as phenomenology and hermeneutics.

Patient engagement should be envisaged as a key priority today to innovate healthcare services delivery and to make it more effective and sustainable. The experience of engagement is a key qualifier of the exchange between the demand (i.e. citizens/patients) and the supply process of healthcare services. To understand and detect the strategic levers that sustain a good quality of patients' engagement may thus allow not only to improve clinical outcomes, but also to increase patients' satisfaction and to reduce the organizational costs of the delivery of services. By assuming a relational marketing perspective, the book offers practical insights about the developmental process of patients' engagement, by suggesting concrete tools for assessing the levels of patients' engagement and strategies to sustain it. Crucial resources to implement these strategies are also the new technologies that should be (1) implemented according to precise guidelines and (2) designed according to a user-centered design process. Furthermore, the book describes possible fields of patients' engagement application by describing the best practices and experiences matured in different fields

Through the use of new technologies, researchers, and practitioners in health education and health communication can now provide health information and behavior change strategies that are customized based on the unique needs, interests, and concerns of different individuals. These tailored health messages can be highly effective in assisting individuals in understanding and responding to health concerns. In this volume, Matthew Kreuter, David Farrell, and their colleagues define the process of tailoring and describe its uses in health communication programs. They present a theoretical and public health rationale for tailoring and support their position with empirical evidence. They also lay out the steps involved in creating and delivering tailored health communication programs, which can then be applied in practice. Practitioners, researchers, and students in health communication, health psychology, public health, and related areas will find this book to be a vital and invaluable resource for improving communication about health issues.
