The backbone of in-patient care is the hospital ward, and I believe that this will remain so in the future. Shortcomings in the staffing, organization and layout of the conventional ward have been recognized for a long time, but there have been few changes and not all these have benefited the patient. The evolution of specialized treatment centres for poliomyelitis, thoracic surgery, burns and so on, showed the need for a new staffing structure—a re-organization of patient care and of secondary importance, new forms of accommodation. These regional or referral centres serve large populations or areas and are collectively known as specialized intensive care (or therapy) units. The idea of using similar principles of staffing, organization and facilities to serve each large district hospital came much later (1959) and was first applied in the United States. Thus, the general intensive care unit was born, a unit which would treat critically ill patients irrespective of the nature of their disease, in sharp contrast to the specialized intensive care unit. The staffing structure and technologies of the two are however similar. Specialized intensive care consists of a single speciality or two specialities, for example thoracic surgery and thoracic anaesthesia. General intensive care cannot be a speciality because it embraces the whole of acute medicine, acute surgery, accident surgery, toxicology and many more individual specialities. This very diversity makes it difficult to organize, but interesting to perform. Mosby's Respiratory Care Equipment - E-Book John Wiley & Sons  
This guide to the principles of anesthesia administration in animals combines user-friendly coverage of essential information with an outstanding illustration program and improved readability. *Anesthesia and Analgesia for Veterinary Technicians, 4th Edition* prepares you to administer anesthesia with information on pre-anesthetic preparation of the patient, induction procedures, monitoring animals' vital signs during the anesthetic period, and postoperative care. Expert authors John A. Thomas, DVM, and Phillip Lerche, BVSc PhD, Dipl ACVA, also include discussions of actions and side effects of anesthetic agents, the physiology of respiration, heart rate and blood

pressure, emergency response, anesthetic equipment, and specialized techniques. . Comprehensive scope of coverage includes both large and small animals. A reading level and depth of information appropriate for the technical level. Easy-to-read, user-friendly format makes this a practical guide in the classroom or in practice. Objectives, key points, and review questions help reinforce learning. Focus on health and safety issues satisfies OSHA requirements. Step-by-step procedure boxes clarify the technician's role in anesthesia delivery. New organization and completely updated techniques, drugs, and equipment keep you up-to-date on the latest advances in the field. 49 new procedure boxes, 20 anesthetic protocol boxes, and 5 case studies help you apply knowledge to real-life situations. Two new large animal chapters cover pain management and anesthetic techniques for equine and ruminant patients. Illustrated, step-by-step procedures and the full-color format make this text inviting and user-friendly. All new figures and 4-color art make the material easy to understand and visually appealing. New material in every chapter incorporates the expanding role of veterinary technician anesthetists, especially in referral practices, teaching institutions, and research. Chapter outlines and Technician Tips emphasize key information and highlight key terms in the glossary. Student resources on the Evolve website include a video animation that demonstrates the use and maintenance of different anesthesia machines.

**Medical Device Technologies** John Wiley & Sons

Medical Device Technologies introduces undergraduate engineering students to commonly manufactured medical devices. It is the first textbook that discusses both electrical and mechanical medical devices. The first 20 chapters are medical device technology chapters; the remaining eight chapters focus on medical device laboratory experiments. Each medical device chapter begins with an exposition of appropriate physiology, mathematical modeling or biocompatibility issues, and clinical need. A device system description and system diagram provide details on technology function and administration of diagnosis and/or therapy. The systems approach lets students quickly identify the relationships between devices. Device key features are based on five applicable consensus standard requirements from organizations such as ISO and the Association for the Advancement of Medical Instrumentation (AAMI). The medical devices discussed are Nobel Prize or Lasker Clinical Prize winners, vital signs devices, and devices in high industry growth areas. Three significant Food and Drug Administration (FDA) recall case studies which have impacted FDA medical device regulation are included in appropriate device chapters. Exercises at the end of each chapter include traditional homework problems, analysis exercises, and four questions from assigned primary literature. Eight laboratory experiments are detailed that provide hands-on reinforcement of device concepts.

During the past twelve years, a course on critical care medicine has been sponsored by the Post Graduate Division of the University of Southern California School of Medicine in association with its Center for the Critically Ill. The content of each of the symposia has paralleled the evolution of critical care medicine as a recognized service specialty. The annual program was planned as a teaching session for physicians and allied medical personnel who sought to advance their involvement in this rapidly advancing field. A panel of highly regarded authorities on subjects bearing on critical care medicine, faculty members of the USC School of Medicine, and staff members of our own Center for the Critically Ill at the Hollywood Presbyterian Medical Center serve as faculty of these symposia. Although the primary commitment of the organizers to maintain this as a teaching and demonstration session was not abandoned, the number of annual registrants progressively increased from fewer than 100 to more than 1200, gradually outstripping local hotel facilities in central Los Angeles. The symposium for the past two years has been held in the large and attractive Anaheim Convention Center adjacent to Disneyland.
