Chemistry: The Molecular Science Holt Rinehart & Winston
 Twenty-First Century Advanced Chemistry has been written for those who seek a higher level of understanding of the general principles or fundamentals covered in a first year level chemistry course. The material covers topics from general chemistry and portions of organic chemistry at a higher level. A strong background in algebra is needed to understand the mathematical equations presented in this book. The goal of sharing such valuable information is to continue to inspire those who seek to contribute to the field of sciences. Topics in science can change or evolve over time with new discoveries being published in journal articles. If we are going to continue the journey to such important ideas, then we need to have a firm grasp of the fundamentals. Twenty-five chapters are included in this book with new chapters or perhaps partially covered in a first year chemistry course. These include chapters on earth's chemistry, chemistry of art, and cosmetic chemistry. The three chapters were included so we can have a better understanding about the chemistry that takes place on our precious planet, a background understanding of art since we are so much attracted to the visual world, and important information for those who purchase and use cosmetics to take care of themselves. The material in this book can change over time, but it is more likely the fundamentals will remain the same. I invite you to explore how great chemistry is as a science and its impact on how it has improved and will continue to improve the quality of our lives for the future.

Enological Chemistry is written for the professional enologist tasked with finding the right balance of compounds to create or improve wine products. Related titles lack the appropriate focus for this audience, according to reviewers, failing either to be as comprehensive on the topic of chemistry, to include chemistry as part of the broader science of wine, or targeting a less scientific audience and including social and historical information not directly pertinent to the understanding of the role of chemistry in successful wine production. The topics in the book have been sequenced identically with the steps of the winemaking process. Thus, the book describes the most salient compounds involved in each vinification process, their properties and their balance; also, theoretical knowledge is matched with its practical application. The primary aim is to enable the reader to identify the specific compounds behind enological properties and processes, their chemical balance and their influence on the analytical and sensory quality of wine, as well as the physical, chemical and microbiological factors that affect their evolution during the winemaking process. Organized according to the winemaking process, guiding reader clearly to application of knowledge Describes the most salient compounds involved in each step enabling readers to identify the specific compounds behind properties and processes and effectively work with them Provides both theoretical knowledge and practical application providing a strong starting point for further research and development

The image on the front cover depicts a carbon nanotube emerging from a glowing plasma of hydrogen and carbon, as it forms around particles of a metal catalyst. Carbon nanotubes are a recently discovered allotrope of carbon. Three other allotropes of carbon-buckyballs, graphite, and diamond-are illustrated at the left, as is the molecule methane, CH₄, from which nanotubes and buckyballs can be made. The element carbon forms an amazing number of compounds with structures that follow from simple methane, found in natural gas, to the complex macromolecules that serve as the basis of life on our planet. The study of chemistry also follows from the simple to the more complex, and the strength of this text is that it enables students with varied backgrounds to proceed together to significant levels of achievement.
