 In the past few decades, there have been great advances in the phylogenetic classification of infectious diseases of man. Taxonomic Guide to Infectious Diseases organizes this information into a standard biological classification and provides a short, clinically-oriented description of every genus (class) of infectious organism. It covers an overview of modern taxonomy, including a description of the kingdoms of life and the evolutionary principles underlying the class hierarchy, and each following chapter will describe one phylum and the genera that contain infectious species. Taxonomic Guide to Infectious Diseases is written in an engaging, narrative style, providing the reader with an easy to digest yet clinically-oriented story of the pathogenic features of each genus. Designed for researchers, clinicians and students of infectious diseases, medical microbiology and pathology. Offers genus-by-genus classification of infectious diseases along with short, clinically-oriented descriptions of each genus Presents comprehensive lists of infectious species for each genera and identifies diseases caused by each species Compiled and written by a well-known pathologist with extensive experience in diagnosing human infectious diseases

Microbiology and virology laboratories provide a diagnostic service that supports the management of patients under the care of front-line clinicians. Despite the significant overlap, laboratory expertise and clinical patient management are traditionally viewed as independent entities. Trainees in the infection disciplines of microbiology, virology, infectious diseases, and tropical medicine have until recently received separate, and as a result, limited training. To address this problem, the UK replaced the FRCPath Part 1 examination for infectious disease trainees with a combined infection training (CIT) curriculum in 2015. Based on the idea of integration and collaboration within the field, CIT links laboratory expertise to clinical patient management. Tutorial Topics in Infection for the Combined Infection Training Programme is the first book covering the complete CIT curriculum. Following the format of the CIT certificate examination, each chapter ends with three single best answer multiple choice questions accompanied by in-depth discussions. This extensive content helps students appreciate the breadth of knowledge required, emphasises how the different aspects of the field are related, and is an essential tool for those preparing for the CIT certificate examination. Written by a multi-disciplinary team of medical microbiologists, virologists, infectious disease physicians, clinical scientists, biomedical scientists, public health specialists, HIV clinicians, and infection control nurses, this well-illustrated and easy to use book offers a unique insight into infectious diseases. It is the perfect primer for further study, a starting point for medical students and professionals wishing to learn more about the different topics within the infection specialty, and ideal for biomedical scientists looking to broaden their clinical understanding of the field beyond the diagnostic test.

Cysticercosis, an infection caused by the cystic larvae of the pork tapeworm *Taenia solium*, is one of the most frequent parasitic infections of the human nervous system (neurocysticercosis). It is endemic in most of Latin America, the sub-Saharan Africa, and vast parts of Asia, including the Indian subcontinent. It has also been increasingly diagnosed in developed countries because of migration of people from endemic zones and exposure in travelers. The life cycle involves the development of the adult tapeworm in the human small intestine (after ingesting infected pork with cysts) and larval infection in pig tissues (after ingesting human stools containing the eggs of the tapeworm). Humans get infected by the fecal-oral route, most often from a direct contact with an asymptomatic *Taenia* carrier. Most common clinical presentations are seizures (particularly late-onset seizures), chronic headaches, and intracranial hypertension. However, cysticerci can locate anywhere in the human nervous system, thus potentially causing almost any neurological syndrome and making clinical diagnosis a difficult task. Neuroimaging is the main diagnostic tool, and specific serology confirms the diagnosis and helps to define the diagnosis when images are unclear. Factors such as location (extraparenchymal versus intraparenchymal), number, size and evolutive stage of the parasites determine the clinical manifestations, therapeutic approach, and prognosis. Management includes symptomatic drugs (analgesics, antiepileptic drugs, anti-inflammatory agents) and in many cases cysticidal drugs, either albendazole or praziquantel. In recent years, efforts have focused on transmission control and potential elimination in endemic regions.

When Biology: A Search for Order in Complexity was originally released in the early 0970s, it was the first text of its kind to challenge the long-standing assumption that a study of biology must be predicated upon the atheistic philosophy of Darwinian evolution. Now, over three decades later, as the so-called theory of evolution faces a deepening crisis, Christian Liberty Press is pleased to present a newly updated and improved version of the textbook that first challenged the modern scientific community with the validity of biblical creationism. *Biology: A Search for Order in Complexity, Second Edition*, is the culmination of over two years of diligent study and labor by a team of educators and scientists who are committed to giving students a greater understanding of and appreciation for the handiwork of Almighty God. Every effort has been made to ensure that this biology text is scientifically accurate and relevant to the needs of students in the twenty-first century. With gratefulness to the Creator of the whole earth, we humbly present this new edition to the public in the hope that it will be a powerful influence in the lives of those who are seeking true science and an understanding of life.
