Markov decision processes (MDP) - is a mathematical process that tries to model sequential decision problems. 5 components of a Markov decision process

1. Decision Maker, sets how often a decision is made, with either fixed or variable intervals.

Handbook of Markov Decision Processes - Adam Shwartz

Description : Continuous-time Markov decision processes (MDPs), also known as controlled Markov chains, are used for modeling decision-making problems that arise in operations research (for instance, inventory, manufacturing, and queueing systems), computer science, communications engineering, control of populations (such as fisheries and epidemics), and management science, among many other fields.

[Applications of Markov Decision Processes in Communication ...](#)

A Markov decision process (MDP) is a discrete time stochastic control process. It provides a mathematical framework for modeling decision making in situations where outcomes are partly random and partly under the control of a decision maker. MDPs are useful for studying optimization problems solved via dynamic programming and reinforcement learning.

CONSTRAINED MARKOV DECISION PROCESSES

Most chapters should be accessible by graduate or advanced undergraduate students in fields of operations research, electrical engineering, and computer science. 1.1 AN OVERVIEW OF MARKOV DECISION PROCESSES The theory of Markov Decision Processes-also known under several other names including sequential stochastic optimization, discrete-time stochastic control, and stochastic dynamic programming-studies sequential optimization of discrete time stochastic systems.

Handbook of Markov Decision Processes: Methods and ...
