 Prepare for success in precalculus as Larson's PRECALCULUS WITH LIMITS, 5th Edition provides specially developed ongoing review in addition to clear explanations, real examples and exercises that relate to everyday life. Written by an award-winning author recognized for his reader-friendly approach, this edition provides a brief review of core algebra topics and coverage of analytic geometry in three dimensions in addition to an introduction of concepts covered in calculus. Updated with proven learning design principles, this edition's consistently structured explanations and carefully written exercises help remove barriers to learning for an inclusive learning experience. New Review & Refresh exercises help you prepare for

each section with a general skill review, while How Do You See It? exercises give you practice applying concepts. In addition, new Summarize features and Checkpoint problems reinforce your understanding of skill sets and let you check your mastery of the concepts.  Three components contribute to a theme sustained throughout the Coburn Series: that of laying a firm foundation, building a solid framework, and providing strong connections. Not only does Coburn present a sound problem-solving process to teach students to recognize a problem, organize a procedure, and formulate a solution, the

text encourages students to see beyond procedures in an effort to gain a greater understanding of the big ideas behind mathematical concepts.

Key Concepts in Mathematics McGraw-Hill Education

Orbital Mechanics for Engineering Students, Second Edition, provides an introduction to the basic concepts of space mechanics. These include vector kinematics in three dimensions; Newton's laws of motion and gravitation; relative motion; the vector-based solution of the classical two-body problem; derivation of Kepler's equations; orbits in three dimensions; preliminary orbit determination; and orbital maneuvers. The book also covers relative motion and the two-impulse rendezvous problem; interplanetary mission design using patched conics; rigid-body dynamics used to characterize the attitude of a space vehicle; satellite attitude dynamics; and the characteristics and design of multi-stage launch vehicles. Each chapter begins with an outline of key concepts and concludes with problems that are based on the material covered. This text is written for undergraduates who are studying orbital mechanics for the first time and have completed courses in physics, dynamics, and mathematics, including differential equations and applied linear algebra. Graduate students, researchers, and experienced practitioners will also find useful review materials in the book. NEW: Reorganized and improved discussions of coordinate systems, new discussion on perturbations and quaternions NEW: Increased coverage of attitude dynamics, including new Matlab algorithms and examples in chapter 10 New examples and homework problems

Handbook of the Psychology of Aging, Third Edition describes the psychology of adult development and aging. This book is organized into four parts encompassing 28 chapters that cover the basic behavioral changes and capacities occurring with advancing age. The first part deals with the history, concept, and models of the psychology of aging. This part also examines the distinctions between physical, biological, psychological, and social time or age. The second part explores the influences of racial, ethnic, and cultural factors on biological/health, social, and psychological aging processes. This part also surveys gender differences in aging. The third part describes numerous behavioral processes, changes, and patterns in advancing age. This part specifically considers the motivation, cognitive and motor performance, attentional processes, learning, memory, personality, and wisdom in aging. The fourth part focuses on the applications of the concepts and principles of aging to the individual and society. This book will be of great value to psychologists, researchers, and graduate students.
