Basicsynth Software Synthesis | botiwall.corebiz.com A software synthesis system needs both instruments to make sounds and a way to control the instruments. By analogy, the synthesizer includes an "orchestra" and a "score." The orchestra consists of the definition of the sound generation instruments, while the score consists of input to the sequencer. Software Synthesis The representation of a signal by a set of samples is the foundation of all digital audio systems, including both CD audio and digital sound synthesizers. Since the sound is represented by a set of numbers, a computer can calculate the sample values directly rather than by sampling an analog input signal. Simply put, a digital sound synthesizer produces sound by generating a series of samples representing the instantaneous amplitude of the signal at a constant time interval. Software Synthesis The Waveform Investigator is a utility program that demonstrates the effect of summing harmonic frequencies at different amplitudes. As such, it implements a simple Fourier series synthesis method. The waveforms created by this method can be stored in a table and used by a wavetable oscillator.
