Wikipedia Numerous queueing models use continuous-time Markov chains. For example, an M/M/1 queue is a CTMC on the non-negative integers where upward transitions from  $i$  to  $i + 1$  occur at rate  $\lambda$  according to a Poisson process and describe job arrivals, while transitions from  $i$  to  $i - 1$  (for  $i > 1$ ) occur at rate  $\mu$  (job service times are exponentially distributed) and describe completed services (departures) from the queue.
