Dental Pathology and Practice To undertake the preparation of a work which should, even approximately, exhaust the topics embraced in the title of this volume would be a task far beyond my intention or even desire. Such an exhaustive treatise would assume proportions which would discourage any but the most ardent student in dental surgery. I have therefore aimed simply to present, as

concisely as possible, the most common and important pathological conditions found in the oral cavity, with the treatment in each condition which has proven most satisfactory in a practice extending through a long series of years. Again, in the great mass of material pertinent to the subject in hand, with which I find myself confronted, much is of the highest importance to every student

in our specialty; but on the other hand, much more is of a character which in my judgment it would be a waste of time and energy to attempt to embody in an intentionally limited work such as I have set before me. I have found also that the selection from this great mass of that which I deem most essential to our special branch of practice is a task of no small magnitude. If I have so solved the

difficulties that this little volume shall prove of service to the student and practitioner of dental surgery, I shall ask for no greater gratification. By the kind permission of my friend, Dr. Bodecker, I have used three cuts taken from his work, "Dental Anatomy and Pathology," to illustrate the first chapter, for which he has my warmest thanks. I take this occasion to express my great admiration

and friendship for my faithful and honest instructor in histology for so many years, Dr. Carl Heitzmann. The great assistance he has always so cheerfully rendered in my studies and in the illustration of the several papers I have had the honor of presenting to the professional and scientific world, I shall always remember with the kindest of feelings.
