Perform discrete-time integration or accumulation of ... Discrete Time Option Pricing Models  
 In finance, the binomial options pricing model (BOPM) provides a generalizable numerical method for the valuation of options. Essentially, the model uses a "discrete-time" (lattice based) model of the varying price over time of the underlying financial instrument, addressing cases where the closed-form Black-Scholes formula is wanting. The binomial model was first proposed by William Sharpe in ... Binomial options pricing model - Wikipedia  
 Black-Scholes pricing analysis -- Ignoring dividends: Lets you examine graphically how changes in stock price, volatility, time to expiration and interest rate affect the option price, time value, the derived "Greeks" (delta, gamma, theta, vega, rho), elasticity, and the probability of the option closing in the money.

 Based on the foundations built in Black and Scholes (1973), the literature has proposed and implemented numerous models and methods for option pricing. There are many option contracts for which a closed form valuation formula is not available. In such circumstances we need to use numerical methods to solve the option pricing problem.
